

Things we will complete today

Aggregate functions

Aggregate functions are functions that take a collection (a set or multiset) of values as input and **return a single value**.

SQL offers five built-in aggregate functions:

- Average: **avg**
- Minimum: **min**
- Maximum: **max**
- Total: sum
- Count: **count**

The input to **sum** and **avg** must be a collection of numbers, but the other operators can operate on collections of nonnumeric data types, such as strings, as well

Aggregate functions

 Find the average salary of instructors in the Computer Science department

```
1 SELECT avg (salary)
2 FROM instructor
3 WHERE dept_name= 'Comp. Sci.'
4

Result #1 (1×1)
avg (salary)
77,333.333333
```

• Find the number of departments in *instructor* relation

```
1 SELECT COUNT(distinct dept_name)
2 FROM instructor

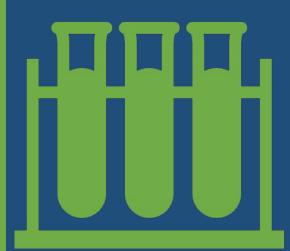

/Result #1 (1×1) \
COUNT(distinct dept_name)
7
```

• Find the number of tuples in the *instructor* relation

```
1 SELECT COUNT(*) AS num_row
2 FROM instructor

Result #1 (1×1)

num_row
12
```

Aggregate functions - Group By

 The GROUP BY statement groups rows that have the same values into summary rows like "Find the average salary of instructors in each department"

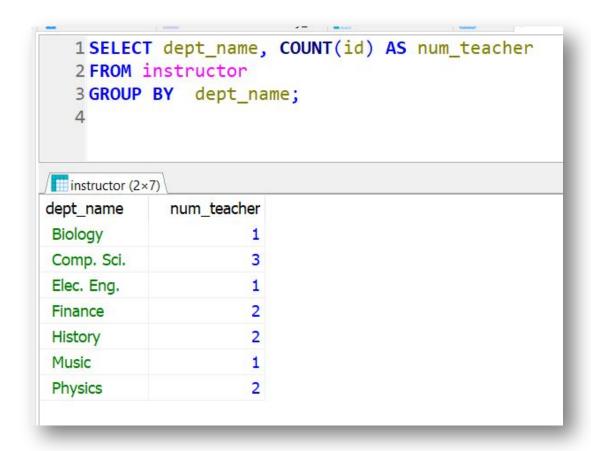

```
SELECT dept_name, avg (salary) as avg_salary
FROM instructor
GROUP BY dept_name;
```

Aggregate Functions – Having Clause

 "Find the number of of instructors in each department which have more than one instructors"

ID	пате	dept_name	salary
76766	Crick	Biology	72000
45565	Katz	Comp. Sci.	75000
10101	Srinivasan	Comp. Sci.	65000
83821	Brandt	Comp. Sci.	92000
98345	Kim	Elec. Eng.	80000
12121	Wu	Finance	90000
76543	Singh	Finance	80000
32343	El Said	History	60000
58583	Califieri	History	62000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
22222	Einstein	Physics	95000

Aggregate Functions – Having Clause

• The HAVING clause was added to SQL because the WHERE keyword could not be used with aggregate functions.

```
SELECT column_name(s)

FROM table_name

WHERE condition

GROUP BY column_name(s)

HAVING condition

ORDER BY column_name(s);
```

Note: predicates in the **having** clause are applied after the formation of groups whereas predicates in the **where** clause are applied before forming groups

Aggregate Functions – Having Clause

The meaning of a query containing aggregation, **group by**, or **having** clauses is defined by the following sequence of operations:

- As was the case for queries without aggregation, the from clause is first evaluated to get a relation.
- If a where clause is present, the predicate in the where clause is applied on the result relation of the from clause.
- 3. Tuples satisfying the where predicate are then placed into groups by the group by clause if it is present. If the group by clause is absent, the entire set of tuples satisfying the where predicate is treated as being in one group.
- The having clause, if it is present, is applied to each group; the groups that do not satisfy the having clause predicate are removed.
- The select clause uses the remaining groups to generate tuples of the result of the query, applying the aggregate functions to get a single result tuple for each group.

Page 88

Null Values and Aggregates

- Total all salaries
 - **select sum** (salary) **from** instructor
 - Above statement ignores null amounts
 - Result is null if there is no non-null amount
- All aggregate operations except count(*) ignore tuples with null values on the aggregated attributes
- What if collection has only null values?
 - count returns 0
 - all other aggregates return null

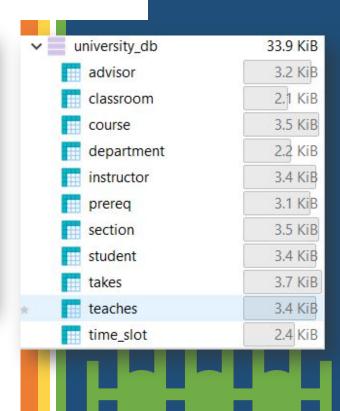

Show me a list containing all <u>teachers name</u>, their respective <u>department</u> and the <u>building</u> the department is situated.

Cartesian Product

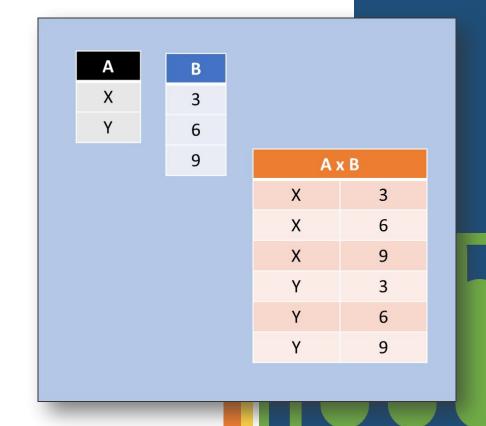

The Cartesian product of two sets A and B, denoted by $A \times B$, is defined as the set consisting of all ordered pairs (a, b) for which

$$\mathbf{a} \in \mathbf{A}$$
 and $\mathbf{b} \in \mathbf{B}$.

For example, if

$$A = \{x, y\}$$
 and $B = \{3, 6, 9\}$, then

$$A \times B = \{(x, 3), (x, 6), (x, 9), (y, 3), (y, 6), (y, 9)\}$$

The Rename Operation

- The SQL allows renaming relations and attributes using the as clause:
 old-name as new-name
- Find the names of all instructors who have a higher salary than some instructor in 'Comp. Sci'.

```
select
    distinct S.name
from
    instructor as S, instructor as T
where
    S.salary > T.salary and T.dept_name = 'Comp. Sci.'
```

• Keyword as is optional and may be omitted instructor as $T \equiv instructor T$

The Natural Join

To make the life of an SQL programmer easier for this common case, SQL supports an operation called the natural join

select name, course_id
from instructor, teaches
where instructor.ID= teaches.ID;

select name, course_id **from** instructor **natural join** teaches;

select $A_1, A_2, ..., A_n$ from r_1 natural join r_2 natural join ... natural join r_m where P;

The Natural Join

To make the life of an SQL programmer easier for this common case, SQL supports an operation called the natural join

```
SELECT
    `name`, teaches.course_id, course.title, `year`
FROM
    instructor, teaches, course
WHERE
    instructor.ID = teaches.ID AND teaches.course_id = course.course_id
```

```
`name`, teaches.course_id, course.title, `year`
FROM
FROM instructor NATURAL JOIN teaches NATURAL JOIN course
```

End.
